A recent study reveals an alarming level of parabens in toothpaste and handwash in Bangladesh, posing severe threats to human health.

Such chemicals could have adverse effects on human health, including disruptions in hormone regulation, reproductive issues, and even potential carcinogenic effects caused by parabens.

Environment and Social Development Organisation (ESDO) conducted the study titled 'Detection of Endocrine Disruption: EDC in Personal Care Products in Bangladesh', in collaboration with the Wonjin Institute for Occupational and Environmental Health (WIOEH) in South Korea.

Excessive parabens found in toothpaste, handwash

Alarming levels of parabens, a family of related chemicals that are commonly used as preservatives in cosmetic products, have been found in toothpaste and handwash of a couple of brands in Bangladesh, posing risks to public health, according to a study.

The use of parabens in daily products can disrupt the endocrine system, which is crucial to hormone regulation. Several nations have opted to completely forbid the use of parabens in these products.

High levels of parabens were found in two toothpaste brands out of seven surveyed, and three handwash brands out of six, according to the study conducted by the Environmental and Social Development Organization (ESDO).

The survey titled ‘Detection of Endocrine Disruption: EDC in Personal Care Products in Bangladesh’ was conducted in collaboration with the Wonjin Institute for Occupational and Environmental Health (WIOEH) of South Korea.

Shanon Iffat Alam, programme associate and research team lead of ESDO, disseminated the study findings at its head office in the capital on Thursday.

Alarming level of paraben in paste, handwash: Study

A new study on Thursday revealed an alarming level of paraben, a chemical additive, in toothpaste, handwash and skin care products in Bangladesh.

The higher level of paraben disrupts the body’s endocrine system, which is vital for hormone regulation. Paraben is any of a group of compounds used as preservatives in pharmaceutical and cosmetic products and in the food industry.
Samples from seven other countries were also investigated before the study found Bangladeshi products contain the highest concentration of paraben in care products.

Cosmetics and personal care products often contain different types of paraben as preservatives because they are effective and affordable.

Because of its side effects, several countries have opted to completely forbid the use of paraben in the products in question.

The Environment and Social Development Organisation (ESDO) in collaboration with the Wonjin Institute for Occupational and Environmental Health (WIOEH) in South Korea conducted the study.

The ESDO shared the findings of the study at a media briefing at its head office in Dhaka city.

CTG POST NEWS

Alarming levels of parabens in handwash and children’s toothpaste

Alarming levels of parabens have been found in toothpaste and handwash in Bangladesh. Parabens are generally used as ‘preservatives in personal care products’ as they are more effective and cost effective. Such chemicals disrupt the functioning of the endocrine system, which is important in regulating hormones in the human body. Its regular use can lead to serious diseases like heart disease or cancer.

These data were found in a recent study by the private research organization Esdo.

The results of the study were announced in a press conference organized at the head office of Esdo on Thursday. The study was conducted in collaboration with the Onjin Institute for Occupational and Environmental Health (WIOEH) in South Korea.

Study finds high level of dangerous parabens in toothpaste and hand wash in Bangladesh
A recent study reveals an alarming level of parabens in toothpaste and handwash in Bangladesh, posing severe threats to human health.

Parabens in toothpaste, a severe threat to human health

A recent study reveals an alarming level of parabens in toothpaste and handwash in Bangladesh, posing severe threats to human health.

Such chemicals could have adverse effects on human health, including disruptions in hormone regulation, reproductive issues, and even potential carcinogenic effects caused by parabens.

Environment and Social Development Organisation (ESDO) conducted the study titled ‘Detection of Endocrine Disruption: EDC in Personal Care Products in Bangladesh’, in collaboration with the Wonjin Institute for Occupational and Environmental Health (WIOEH) in South Korea.

The study was unveiled on Thursday at a media briefing held at ESDO head office in the capital.

Toothpaste and handwash are increasing the risk of serious diseases in the country
Daily use of toothpaste and handwash increases the risk of cancer. Dangerous levels of paraben chemicals have been found in these products produced in the country. But it was not found in foreign products. This information was found in the study of Environment and Social Development Organization (ESDO). This information was presented in a ceremony at the head office of Esdo in the capital on Thursday.

The study was supported by South Korea’s Onjin Institute for Occupational and Environmental Health. Those concerned have called for a ban on the use of harmful chemical parabens. They also emphasized on raising awareness about the presence of parabens in toothpaste and handwash.

Dangerous levels of parabens in Bangladeshi toothpaste

Alarming levels of parabens have been found in toothpaste and handwash in Bangladesh. Parabens are xenoestrogen, which means they have chemical structure similar to the hormones that exist in human body. Parabens can disrupt hormone regulation, cause reproductive problems, and even increase the risk of cancer.

Moreover, extra usage of fluoride in toothpaste disrupts bone balance and affect tooth enamel formation. In addition, excessive use of sodium dichloride can lead to high blood pressure, heart disease, stroke, and kidney problems. A report published yesterday by the research organization ESDO found this information.

Dangerous levels of parabens in toothpaste and handwash

Dangerous levels of parabens have been found in toothpaste and handwash available in the Bangladeshi market.

Thursday (15 February) the study findings were revealed at a press conference at ESDO's head office.

ESDO research finds dangerous levels of parabens in Bangladeshi toothpaste and handwash

A recent ESDO’s research have found concerning levels of parabens in toothpaste and handwash. The research has highlighted the potential adverse effect of these chemicals on human health. Such as parabens can disrupt hormone regulation, cause reproductive problems, and even increase the risk of cancer. On the other hand, excessive usage of fluoride can disrupt bone balance and affect both enamel formation. Moreover, too much usage of sodium dichloride can lead to high blood pressure, heart diseases, stroke and kidney problems.

ESDO research finds dangerous 'parabens' in toothpaste and handwash, cancer risk
Dangerous levels of parabens found in Bangladeshi toothpaste and handwash. A study by the Environmental and Social Development Organisation (ESDO) has found dangerous levels of parabens in toothpaste and handwash products available in Bangladesh.

The results of the study were released at a media briefing at the ESDO headquarters on Thursday (February 15). The study was conducted in collaboration with the Wonjin Institute for Occupational and Environmental Health (WIOEH) of South Korea.

ESDO’s research report

Dangerous levels of parabens found in toothpaste and handwash

Environmental and Social Development Organization—ESDO said that dangerous levels of parabens have been found in toothpaste and handwash used in the country. This information has come up in a recent study by the organization.

The results of the study were released at a briefing at ESDO’s headquarters in Lalmatia, Dhaka on Thursday. The study was conducted in collaboration with the Wonjin Institute for Occupational and Environmental Health in South Korea.

The press conference said that parabens are used as preservatives in personal care products because they are generally more effective and affordable. However, these chemicals disrupt the function of the endocrine system, which is important for regulating our hormones. For this reason, several countries have completely banned the use of parabens in their products.

Parabens in Handwash and Children's Toothpaste at Alarming Levels

Alarming levels of parabens in toothpaste and handwash in Bangladesh. Parabens are commonly used as preservatives in personal care products because they are effective and affordable. These types of chemicals disrupt the function of the endocrine system, which is important for hormone regulation in the human body. Regular use of these chemicals can lead to complex diseases such as heart disease or cancer.

The results of the study were released at a press conference held at the ESDO headquarters, today, on Thursday. The study was conducted in collaboration with the Wonjin Institute for Occupational and Environmental Health (WIOEH) in South Korea.

Cancer risks in toothpaste and handwash

Dangerous levels of the chemical 'paraben' have been found in toothpaste and handwash widely used in the country's market, which will increase the risk of cancer in the human body. It can also cause high blood pressure, heart disease, stroke and kidney problems.
The study was conducted by ESDO in collaboration with the Wonjin Institute for Occupational and Environmental Health (WIOEH) in South Korea.
